

## ABOUT YOUR NEW JACKSON INSTRUMENT

Your new Jackson TVG-2 Television-FM-Video Sweep Signal Generator is a fine instrument. Into it has been built the highest quality and finest performance for which Jackson Service-Engineering is already famous in the radio field. With this new instrument you will be able to service Television and FM sets -- faster, more accurately, and consequently, at greater profit.

Every resource of Jackson -- every bit of Jackson "know-how" have gone into the design and construction of this instrument. It has every feature you will need for true alignment - except one. That one is your own basic knowledge of radio and television. Naturally, the intelligent use of this instrument requires a basic understanding of the workings of various FM and television circuits.

The instructions given in this booklet are, we believe, clear and concise. But since there are many different types of circuits employed in present day television receivers, it is essential that you follow, at all times, the alignment procedure suggested by each set manufacturer. In this way, and only in this way is it possible to secure consistently good results.

If the manufacturer's own instruction materials are not available, it is suggested that you refer to some standard reference service. For general information about Television set alignment, refer to some general information such as Milton S. Kiver's book, "Television Simplified", Rider's "Television - How it Works", or Howard Sam's "Photofact Television Course".
